What is the same (do while) in (python)?

In Python, there is no direct "do-while" loop like in languages such as C or Java, where the code executes at least once before checking the condition. However, you can simulate the behavior of a "do-while" loop using a while loop with some adjustments.

In a "do-while" loop, the code (action) is executed first, and then the condition is checked. In Python, you can achieve this using a while True loop combined with a break statement to exit when the condition is met. Here's an example:

```
while True:    # Action: Code that runs at least once  
print("This code runs at least once")  
  
x = int(input("Enter a number (enter 0 to stop): "))    # Condition: Check after execution  
  
if x == 0:  
  
break  
  
# Exit the loop if the condition is met print("Loop ended")
```
